
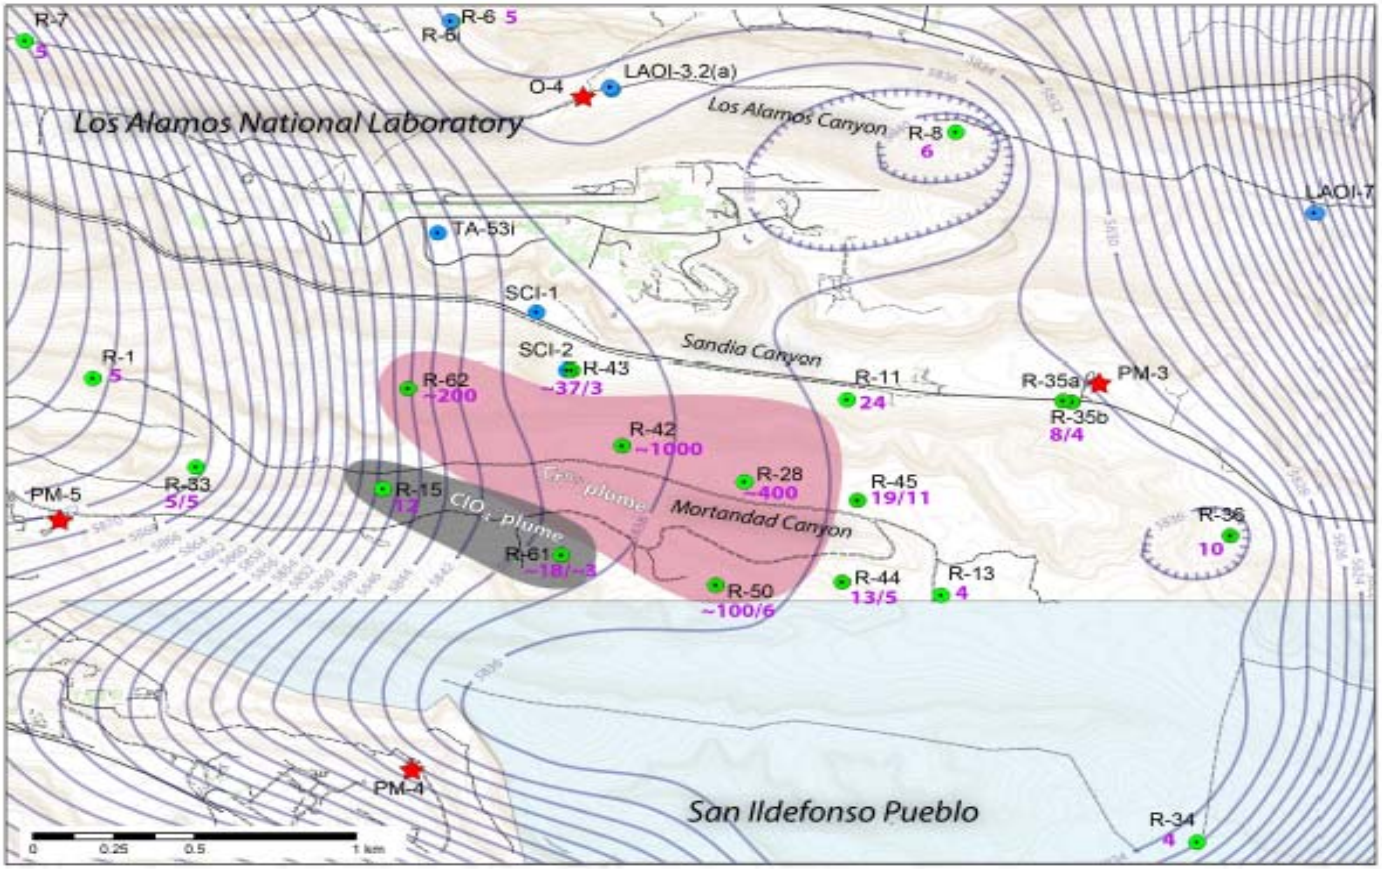

Figure 1.0-2 Plan view of the Cr(VI) plume (>50 ppb contour shown in pink) in the regional aquifer with nearby regional monitoring wells (green circles), perched-intermediate monitoring wells (blue circles), and water-supply wells (red stars). Contour lines (2-ft intervals) represent the regional water table elevations. The approximate area of perchlorate contamination greater than approximately 2 ppb in the regional aquifer is shown in grey. Numbers beneath the well names refer to the approximate chromium concentrations. Two numbers represent concentrations for upper and lower screens.
